

Mold shelves are mainly composed of column sections, drawer layers, pull rods, self-locking devices, etc. They are used to store various molds and are generally used in rows.

The top can be equipped with a hand chain hoist. The horizontal moving trolley for the chicken can facilitate the lifting of the mold, and the drawer layer can be moved out.

The drawer layer is mainly composed of slide rails and shelf boards. The shelf boards are made up of load-bearing frames and steel plates. Each slide rail is fixed front and back, up and down by two bearings.
